

## **Syntax and Comments**

Syntax in JavaScript refers to the rules that govern how JavaScript code must be written in order to be considered valid and executable by a web browser or other JavaScript environment.

For instance Variables must be declared using the let or const keyword etc.

### **Comments**

Comments in programming languages are non-executable text that programmers include in their code to provide explanations, documentation, or reminders to themselves or other developers who may work on the code in the future. Comments are ignored by the compiler or interpreter and do not affect the program's behavior or output.

There are two types of comments

1. Single line comments
2. Multi line comments

//This is the single line comment

/\*This is a multi line comment \*/ when you open a /\* a multi line comment you must have to close it \*/
